

EuroNET – Integrated Security Manager

The EuroNET – Integrated Security Manager platform integrates multiple disciplines into one management platform providing a common interface to the users. The flexible GUI provides the ability to have tree views and multiple windows with docking options. Objects and points across all applications are defined in a common database that enables cross-functional derived logic controls. The software supports multi-level graphics that provide the operator with the option to navigate between them as desired. The platform allows it is possible to integrate the intruder, access control and digital video solutions from Europlex.

To the end user, this translates to comfort and convenience. You can establish a single point responsibility for the monitoring, management and upkeep of all services within your facilities.

Features

Scalability

EuroNET allows the application and the database to reside on a single machine or be on separate (multiple) machines. This allows the database to be distributed across different servers if required (either on a single site or across multiple sites). Each supported hardware platform has its own dedicated communication gateway (driver) allowing the system to be expanded and seamlessly updated when either another Europlex hardware platform is introduced or when the site needs to extend its functionality.

EuroNET- Advantages:

EuroNET integrates security applications on one single management platform (software and database). Supports management and monitoring of;

- Advanced intruder and perimeter monitoring.
- Access control.
- Digital video transmission and recording - including event (access and alarms) linked recording.
- The application can start with one discipline, modularly expanded.

Operator Management

Advanced operator management provides the ability to comprehensively define operator rights together with detailed audit trails. Operators can be assigned to partitions that limit areas and applications under them. Supporting powerful user defined reports, data logs and trends providing the ability to generate the data from cross-functional references. EuroNET is a complete solution for video management enabling the network users to view live video in a managed environment with a browser. The application integrates Distributed Network Video Recorders that act as file servers for recorded video. The integration of video into the core of the application enables the platform to be used as a powerful command station to effectively manage a building or an enterprise across multiple nationwide / worldwide locations.

Supported Hardware Platforms:

Security: VeriNet / SigNET / 3GS
